Amendments to the Claims:

This listing of claims will replace all prior versions, and listing, of claims in the
application:

Listing of Claims:

Claim 1 (currently amended): A memory to provide off boundary memory access,
comprising:

      a right memory array having a plurality of right memory rows;

      a left memory array having a plurality of left memory rows;

      a plurality of row lines each having a right memory row and left memory row,
respectively; and

      an off boundary row address decoder coupled to the right and left memory
arrays, the off boundary row address decoder to perform an off boundary memory access
and wherein the off boundary row address decoder includes a plurality of row decoders,
each row decoder coupled to a respective left and right memory row of a row line, the
row decoder to decode an address to access the desired plurality of memory addresses
data within the respective left and right memory row of the row line and wherein each
row decoder is coupled to at least one adjacent row decoder by a multiplexer.

Claim 2 (original): The memory of claim 1, wherein, the memory is an off boundary
memory.

Claim 3 (original): The memory of claim 1, wherein, the off boundary memory access
includes accessing a desired plurality of memory address from one of a right or left
memory row of a row line and from one of a left or right memory row of an adjacent row
line.

Claim 4 (original): The memory of claim 1, wherein, the off boundary memory access to
be performed within one memory access cycle.

Claim 5 (original): The memory of claim 1, wherein, the off boundary row address
decoder to select appropriate right and left memory rows based upon a starting address
and a sequence number to access the desired plurality of memory addresses.

Claim 6 (original): The memory of claim 1, further comprising:

      A column select decoder to select appropriate bit columns of right and left
memory rows based upon a starting address and a sequence number to access the desired
plurality of memory addresses.

Claims 7-9 (cancelled)

Claim 10 (currently amended): The memory of claim ~~9~~ 1, wherein, the off boundary row address decoder further includes an off boundary detector coupled to each of the multiplexers.

Claim 11 (original): The memory of claim 10, wherein based upon a starting address and a sequence number, the off boundary detector to determine whether an off boundary memory access is needed, and if so, the off boundary memory detector to generate an off boundary signal to control the multiplexers.

Claim 12 (original): The memory of claim 11, wherein, the off boundary signal to control the multiplexers in that after the memory addresses from one of a right or left memory row of a first row line selected by a row decoder are accessed, then the appropriate memory addresses from one of a left or right memory row of an adjacent row line to be accessed by an adjacent row decoder.

Claim 13 (currently amended): A signal processor comprising:
        at least one signal processing unit, the at least one signal processing unit coupled to an off boundary memory by a data bus,
            the off boundary memory including
                a right memory array having a plurality of right memory rows;
                a left memory array having a plurality of left memory rows;
                a plurality of row lines each having a right memory row and left memory row, respectively; and
                an off boundary row address decoder coupled to the right and left memory arrays, the off boundary row address decoder to perform an off boundary memory access, wherein the off boundary row address decoder includes a plurality of row decoders, each row decoder coupled to a respective left and right memory row of a row line, the row decoder to decode an address for accessing the desired plurality of memory addresses data within the respective left and right memory row of the row line, wherein each row decoder is coupled to at least one adjacent row decoder by a multiplexer.

Claim 14 (original): The signal processor of claim 13, wherein, the signal processor is a digital signal processor to perform digital signal processing instructions.

Claim 15 (original): The signal processor of claim 13, wherein, the off boundary memory access includes accessing a desired plurality of memory addresses from one of a right or left memory row of a row line and from one of a left or right memory row of an adjacent row line.

Claim 16 (original): The signal processor of claim 13, wherein, the off boundary memory access to be performed within one memory access cycle.

Claim 17 (original): The signal processor of claim 13 wherein, the off boundary row

address decoder to select appropriate right and left memory rows based upon a starting address and a sequence number to access the desired plurality of memory addresses.

Claim 18 (original): The signal processor of claim 13, further comprising:
        a column select decoder to select appropriate bit columns of right and left memory row based upon a starting address and a sequence number to access the desired plurality of memory addresses.

Claim 19-21 (canceled)

Claim 22 (currently amended): The signal processor of claim 21 13, wherein, the off boundary row address decoder further includes an off boundary detector coupled to each of the multiplexers

Claim 23 (original): The signal processor of claim 22, wherein based upon a starting address and a sequence number, the off boundary detector to determine whether an off boundary memory access is needed, and if so, the off boundary detector to generate an off boundary signal to control the multiplexers.

Claim 24 (original): The signal processor of claim 23, wherein, the off boundary signal to control the multiplexers in that after the memory addresses from one of a right or left memory row of a first row line selected by a row decoder are accessed, then the appropriate memory addresses from one of a left or right memory row of an adjacent row line are accessed by an adjacent row decoder.

Claim 25 (currently amended): A method to provide off boundary memory access in a memory, the method comprising:
        apportioning a memory into a right memory array having a plurality of right memory rows an a left memory array having a plurality of left memory rows;
        defining a plurality of row lines each having a right memory row and left memory row, respectively; and
        performing an off boundary memory access by accessing a desired plurality of memory addresses from one of a right or left memory row of a row line and from one of a left or right memory row of an adjacent row line;
        decoding an address for accessing the desired plurality of memory addresses data within a respective left and right memory row of a row line; and
                coupling each row line to at least one adjacent row line by a multiplexer.

Claim 26 (original): The method of claim 25, wherein, the off boundary memory access is performed within one memory access cycle.

Claim 27 (original): The method of claim 25, further comprising:
        selecting appropriate right and left memory rows based upon a starting address and a sequence number to access the desired plurality of memory addresses.

Application No. 10/076,966   -4-   Docket No. 42P14045

Claim 28 (original): The method of claim 25, further comprising:

   selecting appropriate bit columns of right and left memory rows based upon starting address and a sequence number to access the desired plurality of memory addresses.

Claims 29-30 (canceled)

Claim 31 (currently amended): The method of claim ~~30~~ 25, further comprising:

   Determining whether an off boundary memory access is needed based upon a starting address and a sequence number, and if so, generating an off boundary signal to control the multiplexers.

Claim 32 (original): The method of claim 31, wherein,

   the off boundary signal controls the multiplexers in that after the memory addresses from one of a right or left memory row of a first row line are accessed,

   then the appropriate memory addresses from one of a left or right memory row of an adjacent row line are accessed.
